ORDERING CODE

3.1.1 Variable Displacement Hydraulic Compensation

TECHNICAL INFORMATION

3.1.2 Specifications

Pump size			20 25 31 40 50 63 80 100			100	
Geometric displaceme		[cm³/rev]	22.1 26.9 34.5 42.8 53.1		69.0	86.2	105.5
Pressure	Rated	[bar]	160 150				
Drive	Min.	[rpm]	800 1800				
speed	Max.	[rpm]					
Approx. we	eight	[kg]	13 33 45				
Max. axial shaft	force	[N]	No radial or axial forces allowed.				
Max. radial shaf	t force	[N]					

3.1.3 Hydraulic fluids

The pump series is designed for use with:

Hydraulic oil (normal mineral oil) HLP to DIN ISO 51524/2 or HM ISO 6743/4

Synthetic fluids (Polyolester, HFD-U)

3.1.4 Viscosity range

Normal operating viscosity: 22 - 68 cSt (mm²/s) **Maximum** viscosity at start-up: 400 cSt (mm²/s)

3.1.5 Temperature range

-10 to +50 °C

Note: The highest fluid temperature will be at the drain port of the pump, up to 20 °C higher than in the reservoir.

3.1.6 Seals

The pump series is equipped with NBR or FPM (FKM) seals. The actual seal material is specified in the model code.

3.1.7 Filtration

For maximum pump and system component life time, the system should be protected from contamination by effective filtration. Cleanliness class:

18/16/13 to ISO 4406:1999

or

Class 7 to NAS 1638 or cleaner.

3.1.8 Max. drive and through drive torques

Nominal size		Size 1	Size 2	Size 3
Geometric displacement	[cm³/ rev]	20-25	31.5-40-50	63-80-100
Max. torque on primary shaft	[Nm]	197	400	740
Max. through drive torque	[Nm]	55	110	110 / 180*

^{*} only for combination of size 3 and secondary pump size 3

Note:

Multiple pumps should be mounted in decreasing order of their torque. The sum of the individual torques of the pumps must not exceed the maximum torque permitted on the front pump.

3.1.10 Installation notes

Step 1

PVV100 pumps size 1 can be installed in any position. PVV100 pumps sizes 2 and 3 must be installed horizontally with the compensator at the top (see diagram).

If the pump is installed above the oil level, particular attention must be paid to the suction pressure. The minimum cross-section of the suction line must be equal to the cross-section of pump port.

The suction lines should be as short as possible, with a minimum number of bends and without reducing the cross-section.

Step 2

All return and drain lines must be positioned so that the returning oil is not drawn out again immediately by the pump (see diagram).

The oil tank must be the correct size to dissipate the thermal power generated by the system components, and to achieve a low circulating speed.

To ensure maximum pump working life, the suction oil temperature must never exceed 50 °C. In systems where the pump runs for a long time at a zero flow setting it is recommended that an oil cooler is installed. The pressure in the drain line must never exceed the value specified.

The drain line must always feed directly into the tank, independently of all other lines and it must extend under the minimum oil level to avoid generating foam. In addition, the drain line must be free of restrictions and situated as far as possible away from the suction line.

Step 3

The pump and motor must be connected using a gear coupling.

During assembly, the minimum distance between the two coupling halves must be strictly observed (see Detail A).

Other types of motor-pump couplings are not permitted.

No induced **radial or axial loads** are permitted on the pump shaft.

Step 4

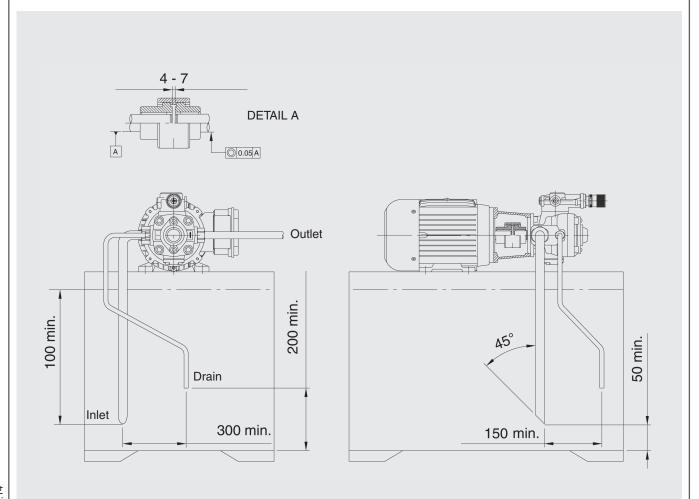

During commissioning, the pump must firstly be run at maximum capacity (P connected to T), with the oil flowing directly into the tank, in order to vent the pump. Size 2 and 3 have an air bleed port on the compensator.

Venting the pump can take several minutes.

Pump filling (oil emerging from the discharge port) should only take a few seconds. If not, the pump must be switched off and the procedure repeated.

Provided that the system and pump are completely full of oil, the pump can be started up during subsequent operation against a maximum pressure of 30 bar.

During both initial commissioning and subsequent start-up operations, the difference between the oil temperature and the ambient temperature (pump case) must not exceed 20 $^{\circ}$ C.

Note

For further information, see brochure section "Installation Instructions for Variable Displacement Vane Pumps".

3.1.11 Adjustments

Pump size	Available displacement [cm³]	Volume adjustment screw rate [cm³]	Min. adjustable displacement [cm³]
